Certification:

The emission behaviour of Winflex® TriSave eco has been tested independently by the institute for analytic Aurachtal. Winflex® TriSave eco has been proved and tested to be very low-emission and particularly does not contain any halogenated flame retardant substances.

Product description:

The climate tape Winflex® TriSave eco Sill ideally complements our Winflex® TriSave eco. Winflex® TriSave eco Sill reduces the effort required for the bottom window joint to a single work step as well. Winflex® TriSave eco Sill guarantees uncomplicated, safe, time-saving and simple installation. Winflex® TriSave eco Sill is easily applied to the bottom window frame, where the window connects to the sill and provides optimal support during window installation. The bottom window joint thus complies with DIN 4108-7.

Winflex® TriSave eco Sill is ideally suited for bottom window sealing, requiring only a few widths to seal the different built-in depths of the base profile. Winflex® TriSave eco Sill fulfils all requirements for seals that are airtight and resistant to driving rain. It has heat and sound insulation properties and is airtight and vapour inhibiting to the inside.

Winflex® TriSave eco Sill offers you the following advantages:

- Tested by MPA Bau Hanover and ift Rosenheim
- Extremely reasonably priced, very simple, fast and long-lasting sealing and insulation of the connection joint in a single step – a clear cost saving through this time advantage
- Both sides of Winflex® TriSave eco are airtight – it can be used on both sides – no risk of confusion
- Building materials load classification BG 1 to DIN 18542: Sealed against driving rain > 600 Pa
Air tight $a < 0.1 \text{ m}^3 / (\text{h} \cdot \text{m} \cdot (\text{daPa})^n)$
- Material class B1 in accordance with DIN 4102
- Very good sound insulation values
- Heat insulating
- Permanent joint drying
- Good compatibility with adjacent materials
- Reliable, simple assembly
- Long term absorption of building movement through elasticity / flexibility
- Can be plastered and painted over
- No soiling of the window surface using liquid adhesive systems
- Contains no solvents or hazardous substance

Technical data:

Building materials load classification	BG 1	DIN 18542
Fire behaviour	building material class B 1 (flame retardant)	DIN 4102, Part 1
Resistant to driving rain	fulfils requirements up to 600 Pa	DIN EN 1027
Thermal conductivity	$\lambda_{10} = 0.040 \text{ W} / (\text{m} \cdot \text{K})$	DIN EN 12667
U-value for 30 mm installation depth	$1.1 \text{ W} / (\text{m}^2 \cdot \text{K})$	
for 35 mm installation depth	$1.0 \text{ W} / (\text{m}^2 \cdot \text{K})$	
for 40 mm installation depth	$0.9 \text{ W} / (\text{m}^2 \cdot \text{K})$	
Joint permeability	$a < 0.1 \text{ m}^3 / (\text{h} \cdot \text{m} \cdot (\text{daPa})^n)$ Class 3	DIN 1026 DIN EN 12207
Diffusion resistance	$\mu \leq 100$	DIN EN ISO 12572
Acoustic insulation	43 dB in 10 mm joint – sound insulation class 4 60 dB in 10 mm joint with additional interior joint sealing with SB-Sil N – sound insulation class 6	according to DIN EN ISO 717 Part 1
Thermal resistance	- 30 °C to + 80 °C	
Processing temperature	+ 5 to + 25 °C	
Shelf life	1 year	DIN 53421
Storage temperature	+ 10 °C to + 20 °C	

Please note:

Always store Winflex® TriSave eco Sill in a temperate climate.

Do not clean using compressed air or solutions with high acetic acid content. Winflex® TriSave eco Sill may not be exposed to solvent-containing or aggressive chemicals.

Winflex® TriSave eco Sill may be painted over with water soluble paints.

Standard dimensions:

Tape description	Installation depth of the base profile	Functional range – joint widths	Length of roll
5 mm x 8 m	30 mm	5 – 10 mm	8 m
	35 mm		
	40 mm		
7 mm x 6 m	30 mm	7 – 15 mm	6 m
	35 mm		
	40 mm		
10 mm x 4.5 m	30 mm	10 – 20 mm	4.5 m
	35 mm		
	40 mm		

Processing notes:

Winflex® TriSave eco Sill replaces three window joint sealing products for the sill region with one product, provided the width of the gap is within the expansion range of the tape; gap widths of 5 to 20 mm can be handled with only three tape sizes.

The width of the gap is determined by measuring the window frames and the embrasure opening. This is required to select the correct tape size. Cut off the over-compressed beginning and end pieces of the tape.

The bonding surfaces on the window frame must be dry and free of oil, grease and dust. If necessary, clean with our Cleaner 10 or Cleaner 20. The cut lengths are then glued to the faces of the prepared window frames.

There is no need to differentiate between the room and outdoor sides and there is no risk of confusion. This requires careful pressing down, preferably using a pinch roller.

This is done by gluing the cut lengths flush with the outer edge, whilst the cut lengths on the left and right are glued leaving a 0.5 cm overhang. Winflex® TriSave eco Sill is used ideally in combination with our Winflex® TriSave eco – see application notes for Winflex® TriSave eco.

When using load bearing blocks, particular attention should be paid to proper expansion of the tape in the region of the blocks. It is recommended to make cuts in the tape to the left and right of the blocks (see drawing).

Remove dirt and mortar residues from the window embrasure.

Afterwards, immediately fit the window into the opening, align and fasten. Ensure that the compressed tape is not damaged by the spacers and alignment material or similar.

Our solvent-free, paste-like, system adhesives of the type Fasatan® - / Winflex® TFS or -TFU in the flow pack are used for levelling rough irregularities and sealing in corners, in tape joints, or in every gap which may occur.

The processing temperature (= component temperature) must not be under + 5 °C.

Expansion behaviour:

It is the delayed reset, that makes Winflex® TriSave eco Sill manageable. Expansion behaviour of the tape depends on the temperature of the joint and the environment. At higher temperatures, the tape expands comparatively fast and the construction part has to be installed in short times. Therefore a storage temperature > 20 °C is to be avoided for longer times and the tape should not be stored in direct sun light. At lower temperatures we recommend to store the tape for at least 24 hours before installation at a temperature of around 20 °C. The expansion of the installed tape may be accelerated by warming with a hot-air gun. Warm the tape in pivoting action.

At temperatures above 20 °C Winflex® TriSave eco Sill should be kept in a cool place even at the construction side, at temperatures below 8 °C Winflex® TriSave eco Sill should be kept at room temperature even at the construction side, because high temperatures accelerate the expansion of the tape, low temperatures decelerate the expansion.

Attention! Important Note:

Above information are based on best present knowledge of current technology, but do not guarantee faultless processing of our products. The information is based on practical results of our tests, but is not binding and does not constitute warranties of characteristics in terms of Federal Supreme Court jurisdiction. Our information does not constitute a legally binding assurance of certain properties or suitability for a specific purpose. Supplementary information by our specialists are merely recommendations, for which no liability is accepted.

Due to the many possible applications of our products, we recommend subjecting the project to a thorough suitability test on original materials before release for further application.

Since our information are non-binding we do not warranty their correctness. For this reason we accept no liability for possible improper processing based on information submitted by our employees.

This technical data sheet replaces all previous versions and is valid until a new version is issued, or until Dec. 31, 2025. Please request the latest version after Jan. 01, 2026.
